

Brief Policy Option Descriptions of State Actions Transportation and Land Use (TLU) Technical Work Group (TWG)

TLU-1. PASSENGER VEHICLES

1.1 PASSENGER VEHICLE TECHNOLOGY

1.1.1 New Vehicle Standards: Tailpipe GHG and Fuel Economy

Newly purchased automobiles comply with state and federal standards. Federal fuel economy standards, federal greenhouse gas (GHG) standards, and state GHG standards all have an impact upon the amount of GHG emissions from newly purchased vehicles.

Recent Actions in FL:

The Florida Department of Environmental Protection (DEP) Air Office has initiated rulemaking as called for in Executive Order 07-127.

1.1.2 Zero Emissions Vehicle/Low Emission Vehicle II Implementation

California's low emissions vehicle II (LEV-II) regulations establish fleet average emissions standards to be achieved by 2010. The program extends passenger car emissions standards to sport utility vehicles and pickup trucks and tightens overall emissions standards. The program regulates smog and ozone-forming air pollutants.

LEV-II requires manufacturers to produce a minimum percentage of zero emissions vehicles (ZEVs), or a commensurate amount of near-zero emissions vehicles, per year. These vehicle types eligible for compliance include electric, hybrid-electric, and alternative fuel vehicles, which have lower GHG emissions than traditional vehicle types. Under the Clean Air Act, states have the option of adopting and implementing California's LEV-II standards, which are stricter than current federal emissions standards.

Recent Actions in FL:

Executive Order 07-127 Initiative, Adopt California motor vehicle emissions standards. DEP Air Office has initiated rulemaking as called for in Executive Order 07-127

1.1.3 R&D and Bringing To Market Lower-GHG Vehicle Technologies

A state could support research and development (R&D) of low-GHG vehicle technologies to encourage technological innovation and accelerate the time period for bringing these technologies to market. Market expansion can also reduce unit costs for these newer technologies.

Recent Actions in FL:

DEP Energy Office is currently funding hydrogen research, development and demonstration projects for hydrogen internal combustion and hydrogen fuel cell vehicles in Orlando. Projects include Ford E-450 passenger bus demonstrations at Orlando International Airport and fleet vehicles operated by Progress Energy and DEP Central District. See <http://www.dep.state.fl.us/energy/sources/hydrogen/projects.htm> Note also that current Florida law allows sales tax exemptions and corporate income tax credits for the purchase of hydrogen-related equipment.

1.1.4 Vehicle Add-On Technologies (e.g., Low-Friction Oil and Fuel Efficient Tires)

Both existing and newly purchased passenger vehicle fuel efficiency may be improved with incremental “add-on technologies.” Some examples of add-on technologies include low-friction oil or low-rolling-resistance tires (LRR) or fuel-efficient tires.

Fuel economy can be improved on light-duty vehicles (LDV) by setting minimum energy efficiency standards for replacement tires. Typically, energy efficient tires are used on new models, however, LRR may not be readily available to consumers, and there is little information regarding the fuel economy of replacement tires.

1.1.5 Support Stronger Federal Corporate Average Fuel Economy Standards

A state may encourage the federal government to adopt and implement stronger corporate average fuel economy (CAFE) standards for newly purchased vehicles.

1.1.6 Programs for GHG Emission Consumer Information for Newly Purchased Cars

To increase consumer awareness about GHG emissions, states may allow, encourage, or require that auto manufacturers affix a “global warming index” sticker to new cars and passenger trucks detailing carbon dioxide (CO₂) and other GHG emissions. These stickers can provide a comparison of the GHG emissions of one vehicle with the average projected emissions from other comparable vehicles of the same model year.

1.1.7 Develop Infrastructure for Plug-In Vehicles

A state may develop infrastructure facilities for plug-in hybrids to recharge at rest areas and fueling stations on limited access highways. These plug-in recharging facilities would provide consumers with more available locations for recharging and allow plug-in vehicles to extend their range to longer distance trips.

1.2 PASSENGER VEHICLE OPERATIONS**1.2.1 Enforce Speed Limits**

Reduced vehicle speeds can improve fuel economy, reduce GHG emissions, and improve safety. One potential implementation method for this enforcement includes speed-detection cameras, for intercity highways and urban roads, which have been shown to be an effective and cost-effective means of achieving compliance with posted speed limits. Enforcement measures could be combined with measures to lower the speed limit on interstates, freeways, and major arterial

roads. Significant enforcement resources may be needed for this measure to achieve the expected reductions.

1.2.2 Vehicle Maintenance and Driver Training

Improved consumer information and education can lead to an increase in fuel efficiency. Consumer education could include the use of “best in class” vehicle guides (e.g., American Council for an Energy-Efficient Economy [ACEEE]) that provide comparative fuel efficiency information about different vehicles and also provide associated vehicle GHG emissions. Public education and training can make drivers more aware of maintenance issues that impact upon pollution and vehicle operating cost, including tire inflation and engine lubricants. Such public education may also encourage energy-efficient driving habits (notably, slower acceleration, shifting at lower revolutions per minute [rpm], and use of cruise control) as well as encourage the use of lower GHG modes of transportation.

1.2.3 Improved Transportation System Management (e.g., Traffic Signal Synchronization and Intelligent Transportation Systems)

Improved transportation system management can improve vehicle flow on the roadway system, which reduces fuel use and GHG emissions. Coordinated operation of the regional transportation network can improve system efficiency, reliability, and safety. Tools to reduce traffic congestion include high-occupancy vehicle (HOV) lanes, roundabouts at appropriate intersections, synchronized signals, incident clearing and management, variable message signs, 511 and other real-time driver information, ramp metering, and other forms of intelligent transportation systems (ITS).

1.2.4 Driver Information Technologies, Including PAYD Insurance

Driver information technologies can provide real-time information on driving habits that have an effect upon GHG emissions. Two important potential elements of driver information are use of an on-board computers and display that provide instantaneous fuel economy information and guidance on more fuel-efficient shifting for manual transmissions. With the introduction of global positioning system (GPS) based pay-as-you-drive (PAYD) insurance, information can also be provided to drivers to increase awareness of their minute-by-minute cost of driving.

1.2.5 Tune-Up Services Including Tire Pressure Checks and Making the Free Air Initiative at Gas Stations Easier

States may allow, encourage, or require tune-up and on demand oil change and engine check facilities to check tire pressure and inflate to the recommended pressure.

1.2.6 Passenger Vehicle Idling Restrictions

States or local governments may enact stricter idling restrictions prohibiting idling for extended durations. States may also implement public awareness campaigns to encourage reduced idling.

Recent Actions in FL:

Executive Order 07-127 Initiative to adopt diesel engine idle reduction standard. DEP’s Air Office has initiated rulemaking as called for in Executive Order 07-12.

1.2.7 School Education Programs

States may implement school instruction for grades 3 through 12 to educate students on the benefits of idling reduction and the consequences of not doing so. Such a curriculum can also address how students may broach this topic with parents or other drivers.

A “lower GHG” curriculum could be developed for teachers to use at the elementary and secondary system levels. Such a curriculum would both distribute information through children to their parents and educate future drivers.

1.2.8 Public Education

States may implement public education programs to better inform the public of the measures individuals can take to reduce their transportation-related GHG emissions.

1.3 PASSENGER VEHICLE INCENTIVES AND DISINCENTIVES

1.3.1 Procurement of Efficient Fleet Vehicles

State and local governments can provide incentives for public and private vehicle fleets to include low-GHG vehicles.

Recent Actions in FL:

Executive Order 07-126 has directed the Florida Department of Management Services (DMS) that when procuring new vehicles, to approve only those with the greatest fuel efficiency in a given class—this requirement extends to Governor’s agencies in Florida State government but does not include Cabinet agencies, the state university system, nor the legislative or judicial branches of state government. These latter entities of state government, as well as local governments are encouraged under the Executive Order to adopt voluntarily all guidance contained therein.

1.3.2 Feebates (State-Specific or Regional) and Establish a Carbon Emission Tax, Modeled After the Clean Air Discount Bill

States may adopt a variety of programs to encourage purchase of lower-GHG vehicles. State incentives could include differential registration fees, feebates, and tax credits. Feebate programs are usually structured to provide incentives for reduced GHG emissions by creating fees on relatively high emission/lower fuel economy vehicles, and rebates or tax credits on low emission/higher fuel economy vehicles.

The Clean Car discount bill provides rebates to those who purchase vehicles that emit low levels of GHGs while placing an additional surcharge upon those vehicles that are higher emitting vehicles.

1.3.3 CO₂-Based Registration Fees and Vehicle Licensing Fees

Higher vehicle registration fees can be charged for vehicles that have higher emissions, and vehicles that emit less could be charged a lower vehicle registration fee. Vehicle licensing fees could also be based on vehicle weight, with use of a dollar-per-vehicle-ton multiplier instead of the present broad categories of vehicle weight.

1.3.4 Tax Credits for Efficient Vehicles

Tax credits can be offered for the first-time purchase of a hybrid, alternative fuel vehicle or other type of vehicle that is relatively lower in GHG emissions.

1.3.5 Vehicle Scrappage

State and local governments may adopt incentives program to accelerate the replacement or retirement of passenger vehicles with higher GHG emission rates. Because of the energy input required for manufacture of new vehicles, keeping low-GHG emitters in the fleet longer will also provide benefits for vehicles that are well maintained.

1.3.6 Emission-Based Tolling (Discounts for Clean Vehicles)

Drivers of more fuel-efficient vehicles may pay lower tolls than drivers of less fuel-efficient vehicles. This measure has been implemented for trucks in Germany.

1.3.7 Establish a Fleet Replacement Grant Program

A government may incentivize earlier retirement of older fleet vehicles by creating a grant program that helps vehicle owners to purchase more fuel efficient, lower GHG emitting vehicles.

1.3.8 Provide a Tax Incentive for Bicycles

Governments may provide incentive for the purchase, use, and commute by bicycle. In England, a program such as this allows employees of participating employers to choose a bicycle they will use, along with safety and security equipment.

1.3.9 Support Alternative Travel in the Advertising Mainstream

States may promote the use of alternative travel such as walking, cycling, and the use of trains, buses, and trolleys through mainstream advertising media such as television, billboards, radio, and magazines.

1.4 FUEL RELATED MEASURES**1.4.1 Low-GHG Fuel Standard (e.g., Renewable)**

Adopt a low-GHG fuel standard. This option would reduce GHG emissions by decreasing the carbon intensity of all passenger vehicle fuels sold in the state. The low carbon fuel standard (LCFS) would require all fuel providers in the state to ensure that the mix of fuel they sell into the state market meet, on average, a declining standard for GHG emissions measured in CO₂ equivalent grams per unit of fuel energy sold. The state should regulate quality standards for low-carbon fuels. Low-carbon fuels include, but are not limited to, biodiesel, cellulosic ethanol, hydrogen, compressed natural gas (CNG), liquefied petroleum gas (LPG), electricity, and low-carbon blends such as E10 (a fuel mixture of 10% ethanol and 90% gasoline) or E85 (a fuel mixture of 85% ethanol and 15% gasoline).

The standard would be measured on a life cycle basis in order to include all emissions from fuel production to consumption. Options for compliance may include blending or selling increasing

amounts of lower carbon fuels, using previously banked credits, and purchasing credits from fuel providers who earned credits by exceeding the standard.

This option could also promote R&D related to biofuels production, such as the use of enzymes for breaking down cellulose to produce ethanol (as opposed to corn-based ethanol, which has a lower life cycle benefit).

Recent Actions in FL:

Also known as a LCFS. Phase I Report Recommendation—Develop policies which promote the use of low carbon emission vehicles and evaluate a low carbon fuel standard to be developed into a regional standard with other southern states.

1.4.2 Low-GHG for State Fleets (e.g., CNG, Biodiesel)

Mandate that public vehicle fleets include alternative fuel vehicles, typically targeting a certain percentage of penetration within a certain period of time. These mandates could be used to require pure electric vehicles or plug-in electric vehicles for fleets.

Recent Actions in FL:

Executive Order 07-126 declares that all state agencies shall use ethanol or biodiesel fuels when locally available.

1.4.3 Alternative Fuel Expansion (Biodiesel, CNG, LPG, Cellulosic Ethanol, Liquid Fuels, Gas Fuels, Energy Electrons, Hydrogen)

Adopt standards that require a certain amount or percentage of fuel sold within the state to be a renewable fuel (e.g., ethanol or biodiesel). This percentage can gradually increase over time. The state can help facilitate transition to renewable fuels by regulating quality standards for fuel blends.

This option could also promote R&D related to biofuels production, such as the use of enzymes for breaking down cellulose to produce ethanol (as opposed to corn-based ethanol, which has a lower life cycle benefit).

Recent Actions in FL:

Action on biofuel expansion in Florida dates to 2006 Energy Bill—to date, actions include the following: Current efforts include: Florida Department of Agriculture and Consumer Services (DOACS) Florida Farm to Fuel program which in fiscal year (FY) 2007–2008 included \$25 million in grants; Florida Department of Environmental Protection (FDEP) Renewable Energy Technologies Grant Program which funded some liquid biofuels in FY 2006–2007; and \$20 million FY 2007–2008 to University of Florida Institute of Food and Agricultural Sciences (UF IFAS) for cellulosic ethanol. See http://www.floridafarmtofuel.com/2008_Grants_Award.htm for 2008 Farm to Fuel grant awards.

DOACS is currently in rulemaking to amend fuel quality provisions to address biofuel blend issues

1.4.4 Alternative Fuel Infrastructure Development

Directly offer or create incentives to private providers of alternative fuel infrastructure. The development of an alternative fuel infrastructure can aid in the promotion of alternative fuel usage. The expense of equipment and installation costs can be offset by creating an infrastructure. The convenient locations of stations offering alternative fuels at competitive prices can increase the usage of the fuel.

Recent Actions in FL:

Current efforts date from the 2006 Energy Bill; provisions include:

- Sales tax exemption for fueling equipment;
- Corporate income tax credit for production and fueling equipment; and
- Total expanded to \$42.5 million for biofuel grants and tax incentives in Governor's recommended budget for FY 2008–2009.

Action Team Phase I Report Recommendation—Support existing tax incentives for the development of alternative fueling transportation infrastructure.

See this site for Florida's current biofuel fueling infrastructure: <http://www.doacs.state.fl.us/standard/petro/AltSiteMap.html>

1.4.5 Fund R&D for a Full Range of Renewable Transportation Fuels

Provide funding to assist in the development of low carbon fuels that are not yet commercially viable, such as cellulosic ethanol. Provide an accurate analysis and recommendations of which renewable fuels will be the best options for the state, region, or city.

Recent Actions in FL:

Phase I Report Recommendation.

1.4.6 Develop Life Cycle Analyses of Transportation Fuels To Determine the Appropriate Pathways To Sustainably Protect Natural Resources

Examine the complete impacts of transportation fuels looking at the environmental impacts for the full life cycle of the fuel. For example, in examining corn ethanol the study would look at the environmental impact of growing the corn including fertilizers used, emissions from farm equipment, construction and operation of processing facilities, emissions and safety risks from transporting the fuel, and all the way through to the emissions released from the burning of the fuel versus the energy output of the corn ethanol.

Recent Actions in FL:

Phase I Report Recommendation.

TLU-2. LAND USE EFFICIENCY AND MODAL OPTIONS

2.1 GENERAL LOCATION EFFICIENCY

2.1.1 Statewide Growth Management Plan

Adopt a statewide growth management plan and corresponding GHG emission goals. The plan would provide specific guidance for regional (metropolitan planning organization [MPO], County, or Municipal) transportation and land use plans and programs to help them conform to the state-determined GHG budgets and vehicle miles traveled (VMT) per capita targets set in the statewide growth management plan.

Recent Actions in FL:

Phase I Report Recommendation. GHG emission reduction strategies should be incorporated into state, regional, and local growth management and transportation planning processes.

2.1.2 Include GHG Evaluations in State Policies

Require state transportation and land use legislation, regulations and policies, capital funding programs, long-range transportation plans, and the project environmental review process to evaluate their GHG implications. This will help serve as a mechanism to support climate-friendly and energy efficient policies and development patterns.

2.1.3 Shape Investment To Maximize GHG Reductions

Guide public and private land use development and investment toward maximizing GHG reductions and growth management. This would be accomplished by adoption or strengthening of an Indirect Source Rule to hold development accountable for GHGs, Transfer of Development Rights, Open Space Protection, Coastal Zone Management, and Adequate Public Facilities initiatives.

2.1.4 Provide Technical and Financial Support to Local Agencies

Provide technical and financial support to MPOs, planning offices, and related local/regional agencies for land use, planning, and zoning activities to provide and enhance technical tools, increase technical capacity, and fund Blueprint Planning Grant programs.

2.1.5 Smart Growth Planning, Modeling, Tools

Provide state funding, information dissemination, and technical assistance to facilitate the adoption of smart growth planning processes, models and tools by local and regional jurisdictions. Smart growth planning, modeling, and tools are methods of development that reduce sprawl and maximize environmental, fiscal, and economic resources. This form of planning and modeling often incorporates other planning tools such as mixed-use, open space protection and transit-oriented development.

Recent Actions in FL:

In accordance with Executive Order 07-127, Florida Department of Community Affairs (DCA) is in the midst of rulemaking to establish a 15% increase in energy efficiency. They are

scheduled to amend Florida Energy Code Rule 913-13 by May 2008 for implementation by October 2008. The Executive Order requirements for the building code revisions do not, however, extend to the changes in land use described here.

2.1.6 Land Use, Zoning, Tax and Building Code Reform

Modify and fund reforms of state and local property tax, development fees, and zoning/building codes and policies to support GHG reductions and the implementation of state growth management plans. Measures can include property tax assessment policies regarding empty or underdeveloped urban lots to encourage infill development, reducing building setback requirements, shifting parking minimum requirements to maximum standards, reducing restrictions on density, floor area ratios and mixed-use development, and reforming on-street parking availability and pricing.

2.1.7 State Congressional Advocates for Federal Action

Pass legislation petitioning that the state's congressional delegation works for federal highway, transportation and land-use related legislation/programs supporting timely climate change action.

2.1.8 Use of Flexible Federal Transportation Funding

The Safe, Accountable, Flexible, Efficient, Transportation Equity Act: A Legacy for Users (SAFETEA-LU) authorizes \$286 billion in spending between 2004 and 2009 for numerous surface transportation programs such as highways, transit, freight, safety, and research. Much of this funding is flexible in terms of its utilization by the state, and full funding for transit, pedestrian and bicycle facilities, intercity rail, and other climate-friendly investments should be prioritized.

2.1.9 Downtown Revitalization

Provide economic development incentives (e.g., tax-based) and liberalize zoning and permitting processes (e.g., parking requirements, density and mixed-use restrictions) to encourage investment in downtowns and central business districts. Revitalizing downtown areas can reduce automobile travel for commuters and provide sufficient density to support transit operations, thereby providing two means of reducing GHG emissions.

2.1.10 Brownfield Redevelopment

Provide economic incentives, liberalized zoning and land use restrictions, and permit streamlining to encourage development of empty or underutilized industrial facilities and derelict properties in urban areas. Redeveloping brownfields in urban areas can be a key factor in urban revitalization providing new centrally-located areas for residential, commercial, or mixed-use development. By producing "infill" of existing urban areas it also reduces average trip distances and can save public funds by taking advantage of existing infrastructure and public utilities.

2.1.11 Infill Development

Provide economic incentives, liberalized zoning and land use restrictions, and permit streamlining to encourage development of vacant or underutilized properties (e.g., surface parking lots) in urban areas. Infill development is the process of developing vacant or under-used

parcels of land within existing urban areas that are already largely developed. By producing “infill” of existing urban areas it also reduces average trip distances and can save public funds by taking advantage of existing infrastructure and public utilities.

2.1.12 Transit-Oriented Development

Provide economic incentives, liberalized zoning and land use restrictions, and permit streamlining to encourage dense mixed-use development of properties in proximity to transit stations or facilities. Transit-Oriented Development (TOD) is the creation of compact, mixed-use commercial or residential communities, designed to maximize access to public transit and create a community attractive to pedestrians and bicyclists. TOD is thus a tool that can be used to reduce automobile travel and the associated GHG emissions by increasing travel options and transit ridership.

Recent Actions in FL:

Phase I Report recommendation

2.1.13 Traffic Calming

Traffic calming measures such as roundabouts, speed bumps, and chokers result in traffic moving at slower speeds and with smoother flow (e.g., roundabouts reduce full stops at intersections). The reduced speed and smoother flow of traffic is associated with a reduction in GHG emissions and makes these areas more attractive, convenient and safe for bicyclists and pedestrians, encouraging these climate-friendly modes.

2.1.14 Targeted Open Space Protection

Adopt a comprehensive state plan to preserve open space, especially on the periphery of urban areas where “sprawl” development may otherwise occur. Targeted Open Space Protection typically includes programs or policies designed to protect and conserve state land, and recreational and agricultural areas.

2.1.15 Balance Economic Development with Agriculture, Protection of Natural Resources, and Preserving Rural Character

Adopt a comprehensive state plan to preserve agricultural land uses, protect natural resources, and preserve rural character, especially on the periphery of urban areas where “sprawl” development may otherwise occur. Involves taking multiple land uses and policy objectives into consideration, including economic development, agriculture, the preservation of natural resources, and the preservation of the rural character of a given area when examining future development patterns and the economic needs of an area.

Recent Actions in FL:

Phase I Report recommendation

2.2 INCREASE LOW-GHG TRAVEL OPTIONS**2.2.1 Make Full Use of CMAQ Funds—With Application Reviews Considering GHG Reductions**

Fully allocate all funding from the federal Congestion Mitigation and Air Quality (CMAQ) program and prioritize its use for GHG-reducing investments.

2.2.2 Improve Transit Service (Frequency, Convenience, and Quality)

Improve existing transit service (e.g., expanded hours or coverage of bus service, higher frequency bus routes, investments in rail transit) to generate greater use of public transit and a consequential reduction in automobile travel by. This option could also include expansion of intercity bus service. Use of Florida Department of Transportation (FDOT) data on travel origins and destinations could help determine whether there are intercity regional routes that need prioritization.

2.2.3 Transit Marketing and Promotion (Including Individualized Transit Marketing)

Fund enhanced promotion and marketing of transit to achieve greater use of public transit and a consequential reduction in automobile travel. A state subsidy to encourage the adoption of transit passes or allow for a reduction in transit fares could be part of this program. Targeted transit marketing has proved to be highly effective in reducing auto trips through increased transit use.

Recent Actions in FL:

Phase I Report recommendation; to promote energy efficient mass transit whenever feasible.

2.2.4 Expand Transit Infrastructure (Rail, Bus, Bus Rapid Transit)

Increase funding for new public transit infrastructure (e.g., rail lines, bus rapid transit [BRT] routes). Greater use of public transit and reduction in automobile travel can be achieved by expanding public transit infrastructure. This option also could include expansion of intercity bus service (e.g., by providing centrally located urban bus terminals or pick-up areas). New transit lines increase the population base served by a transit system, extend system coverage for existing system riders, and expand the overall commercial, residential and retail market served. Infrastructure improvements, such as physical track upgrades or the conversion of mixed traffic lanes to dedicated bus or light rail lanes, can significantly aid level of service measures.

2.2.5 Transit Prioritization (Signal Prioritization, HOV Lanes)

Improve transit level of service (travel time, reliability and frequency) for urban buses and light rail through prioritization measures such as signal prioritization (where a transponder on the transit vehicle accelerates or extends the green cycle on traffic lights allowing the vehicle to avoid many red lights), or lane-specific prioritization (preemptively turning a red light green in a lane occupied by a bus or in an appropriate turn lane, thus allowing the bus to merge or turn several seconds in advance of other traffic). Prioritization can also be achieved for buses through HOV lanes, which offer higher travel speeds.

2.2.6 Guaranteed Ride Home

Provide state funding to transit agencies and local jurisdictions to establish or expand guaranteed ride home (GRH) programs. This program encourages carpooling and transit usage by providing a back-up means to return home. Generally, this is aimed at persons concerned that without their own private vehicle at work, they will not have transportation in case of unexpected overtime, early departures for family sickness or emergencies and similar situations. A limited number of times annually participants are eligible for alternative transportation—including taxi fare where appropriate—to provide this back-up transportation.

2.2.7 Create Regional Intermodal Transportation Centers

Provide funding for intermodal terminals in centralized location(s) where various forms of passenger transportation connect to one another, such as rail, bus, and bikeways. The intermodal centers can significantly improve the level of service for users by facilitating easier transfers, which can be established with coordinated schedules minimizing transfer wait times. Transfer timing/coordination improvements can be made through both improving and publicizing better connections between bus and rail services. The high value that travelers place on waiting time makes these improvements especially effective.

2.2.8 Bike and Pedestrian Infrastructure

Improve, construct, and promote sidewalks and bikeways to increase pedestrian and bicycle travel and reduce automobile use. The provision of new sidewalks and improvements to existing sidewalks can facilitate many shorter trips by non-motorized means. The provision of bicycle lanes can be both on shared streets and on segregated facilities physically separated from roadways except at crossings. Physical improvements could also include bicycle parking and shower or locker amenities at places of employment. Require local government “complete streets” policies, providing for systematic adoption of sidewalks and a network of bicycle lanes, to help achieve these improvements.

2.2.9 HOV Lanes

Increase funding and identify appropriate locations for additional HOV lanes. HOV lanes can be added through new road capacity designated for HOVs or by converting existing lanes, and can also employ reversible lane strategies. HOV lanes are usually in effect only in the peak direction during rush hour, however, HOV lanes can also be in effect 24 hours. HOV programs are most successful as part of an integrated regional transportation strategy that includes other improvements (e.g., park-and-ride facilities) and incentives for transit and rideshare use.

2.2.10 Vanpooling and Carpooling

Provide financial incentives or preferential treatment for vanpools and carpools and fund supporting regional ride-matching programs. These options reduce VMT associated with workplace commuting as well as reduced rush hour traffic congestion and the GHG emissions associated with traffic. Regional ride-matching programs provide a centralized database for matching drivers with others with similar commute schedules, origins and destinations. Because of registration requirements, participant identities are known, addressing safety concerns.

2.2.11 Park-and-Ride Lots

Provide additional state funding for park-and-ride lots. This strategy will expand the construction of well lighted and police patrolled parking locations for carpoolers and others to interface with buses, light and heavy rail, as well as commuter trains in the state. It is most effective when implemented jointly with HOV lanes as well as transit service. While participants still must drive to the lot location, each facility still decreases VMT—especially the portion on the more congested radial commute routes—by a significant amount.

2.2.12 Car Sharing

Provide funding or subsidies, and reserved parking locations, for the introduction/expansion of public or private car-sharing operators. This measure represents the introduction of hourly rental schemes, with vehicles available at numerous locations throughout metropolitan area. These schemes have reduced VMT largely through providing an alternative to car ownership, thus eliminated fixed vehicle costs (purchase/depreciation, insurance, and parking) and converting them to marginal costs. As vehicle owners determine that they can lower their overall transportation costs by disposing of one or more owned vehicles and participating in car sharing, annual VMT for these households can fall significantly.

2.2.13 Telecommute, Live-Near-Your-Work, and Compressed Work Week

Provide incentives to employers to provide options such as telecommuting, live-near-your-work, and compressed work weeks to reduce automobile commutes. The telecommuting option includes the development and utilization of neighborhood telecommuting centers that offer office-type services in locations close to commuters' residences. Live-near-your-work, also known as "proximate commute," encourages organizations with multiple locations (e.g., banks, fast food restaurants) to transfer employees such that the maximum number work at the branch location closest to their home. A compressed workweek (for example, four ten-hour days of work) can reduce the numbers of commute trips at organizations that are able to accommodate this.

2.2.14 Require Government Agencies To Use Telecommuting

Require the state government to offer telecommuting for appropriate employees, which would reduce work trips and would provide a lead-by-example for public and private industries.

2.2.15 Telecommuting Centers, Support and Incentives

Provide funding for regional telecommute centers and incentives for their use. These facilities vary in their details, but provide an office-type environment where employees can receive various levels of logistical support to telecommute. Employees can avoid having to create their own home work space and the distractions that sometimes correspond, employers can know their employees are in an office setting, and the facilities significantly decrease vehicle commute mileage.

2.2.16 E-Commerce

Provide a sales tax exemption for all e-commerce. LDV trip reductions can be achieved through the use of e-commerce instead of traditional means of shopping involving passenger vehicle travel.

2.3 INCENTIVE AND DISINCENTIVES**2.3.1 Commuter Choice Programs/Parking Cash Out**

Provide incentives for employers to offer Commuter Choice Programs. These programs encourage employers to provide options such as telecommuting, transit subsidies, pre-tax transit fare program, parking cash-out, and guaranteed ride home service to reduce automobile commutes. Parking cash-out is a federal tax programs that allows employees to receive a cash payment as an alternative to receiving employer-paid parking. Transit benefits are a parking cash-out variant that allows employees to receive a tax-exempt payment valid on local transit systems. Commuter choice programs can also provide a ride-matching service solely within the employer's workforce, arrange and subsidize vanpools, and provide preferential parking and other amenities to carpoolers or others who do not drive alone to work. As an incentive to develop and provide such services, a tax credit can be offered to companies. Government spending to encourage commuter choice can stimulate a large private-sector match.

2.3.2 Adopt Best Workplaces for Commuters Policies

Florida would adopt for state employees and provide incentives to other organizations to adopt the policies and programs as set forth by the U.S. Environmental Protection Agency's (US EPA's) Best Work Places Program to reduce VMT associated with daily work commutes. For more information, see: <http://www.bestworkplaces.org>

2.3.3 Issue Free Bus Passes to Downtown Workers, Students, and Retired People

Provide funding to transit agencies for free bus passes for those who work in congested downtown areas, students, and retired persons. *Transit pass programs* allow discounted or unlimited rides within a given time period or number of rides. This measure serves to increase ridership by price-sensitive customers (e.g., college/university students). It also significantly helps replace personal vehicle trips with transit trips because these trips have become sunk costs—thus they are free from a customer perspective, but because they are replacing a personal vehicle trip, they represent a no-cost mode shift to transit.

2.3.4 Transit Pricing Incentives

Provide a subsidy to transit agencies to reduce their fares. This option would include various incentives that give discretionary travelers reasons to choose transit. This could include reduced fares (for populations such as seniors or time-based such as off-peak) or offer discounts. Reducing fares is one important means to increase transit ridership; however, it is neither the only nor necessarily the most cost-effective means of increasing ridership.

2.3.5 Free Downtown Parking for Carpoolers

Provide free downtown parking for carpoolers at municipal lots or through vouchers issued to carpoolers or a subsidy to private parking operators. Provides an incentive for carpoolers while discourages single-occupancy vehicles (SOVs).

2.3.6 Reserve Parking Spaces for HOVs and Car-Share Programs

Set standards for local jurisdictions to reserve parking spaces for HOVs and car-share programs. This program provides incentives for those that carpool or use car-sharing programs.

2.3.7 Benefits for Low-GHG Vehicles (Preferential Parking, Use of HOV Lanes)

Provide incentives to drivers of vehicles with low GHG emission rates. This would both vehicles using alternative fuels and those with high fuel economy. Depending on effectiveness, these incentives could include preferential vehicle access to metered parking spaces or HOV lanes.

2.3.8 Location-Efficient Mortgages

Pass legislation permitting location-efficient mortgages and encourage and support their implementation. In this program mortgage providers establish a lending program that reflects transportation cost savings of living near transportation-oriented developments (from not owning or frequently using a car) in what potential homeowners can borrow.

2.3.9 VMT Charges

The state would charge a tax or fee reflective of miles traveled by passenger vehicles. It would be collected through odometer audits at annual vehicle inspection visits or through GPS or similar systems as they become increasingly commonplace. In many cases it has been proposed that the fee be revenue-neutral, offsetting fuel tax revenue that is on a trajectory to otherwise decline with improving fuel economy and increased use of untaxed alternative fuels. As an alternative, revenues could be increased somewhat and used to fund transit and other transportation alternatives within a corridor or region.

Recent Actions in FL:

Currently DCA has proposed a pilot program for this option in their 2008 legislation.

2.3.10 Increased Fuel Tax (With Targeted Use of Revenue Toward Travel Alternatives)

Increase the state tax on conventional fuels. Revenues can be dedicated to fund transit and other transportation alternatives within a corridor or region.

2.3.11 PAYD Insurance

The state would pass necessary legislation to allow, encourage and support the provision of PAYD auto insurance, possibly including state support for additional pilot programs. This measure converts vehicle insurance from a relatively fixed annual amount (which varies little by mileage), to a mostly mileage-based rate. Thus, instead of paying \$480, \$600, or \$720 annually depending on one's actuarial bracket, one would pay \$0.04, \$0.05 or \$0.06 per mile (based on the national average of 12,000 annual miles), plus perhaps a fixed amount to reflect theft or

certain other largely mileage-independent risks. This measure has been shown to be a more accurate and equitable reflection of actual risks, and has already been adopted as an insurance option in several states.

2.3.12 Congestion Pricing (With Targeted Use of Revenue Toward Travel Alternatives)

Increase the introduction of tolls and road pricing that varies with congestion levels (congestion pricing). This measure can be particularly effective at reducing congestion and thus significantly improving vehicle fuel economy, in addition to bringing about some reduction in VMT. Roadway pricing revenues can help fund needed highway improvements and help manage system-wide demand. In addition, pricing revenues can be used to fund transit and other transportation alternatives within a corridor or region.

2.3.13 Emission-Based Tolls (With Targeted Use of Revenue Toward Travel Alternatives)

Introduce emission-based tolls based on new car ratings and other vehicles' inspection results, similar to a system now in place in Germany. Toll revenues can help fund needed highway improvements and help manage system-wide demand. In addition, pricing revenues can be used to fund transit and other transportation alternatives within a corridor or region.

2.3.14 Urban and Intercity Road Tolls (With Targeted Use of Revenue Toward Travel Alternatives)

Increase the use of and raise the rates for urban and intercity road tolls. Intercity tolls should be introduced on non-tolled intercity expressways and raised on currently tolled facilities. These measures may be expanded in part due to new private or public-private partnership toll highways, or the conversion of existing public highways to this status. Roadway pricing revenues can help fund needed highway improvements and help manage system-wide demand. In addition, pricing revenues can be used to fund transit and other transportation alternatives within a corridor or region.

2.3.15 Cordon Pricing

Implement cordon pricing (area pricing), as has been done in London, Stockholm, Singapore and several Norwegian cities, and is likely to be implemented soon in San Francisco. Cordon pricing involves the implementation of a toll to drive within central urban areas, using electronic, camera, or similar toll collection to avoid the need for tollbooths.

2.3.16 Parking Pricing, Excise Tax, and Supply Restrictions

Establish state standards, with incentives for local adoption, of parking management strategies. Automobile use is strongly influenced by the location, supply, and pricing of parking. Local governments can encourage reduction in automobile use by eliminating minimum parking supply requirements, establishing parking supply caps, encouraging higher parking prices, and other mechanisms. Parking ratios for the maximum number of spaces allowed can be set based on the level of transit service an area has. Smart parking identification systems can help inform drivers of parking availability and reduce excessive circling and searching.

2.3.17 VMT/GHG Offset Requirements for Large Developments

Require the identification of GHG emissions and mitigation measures as part of the environmental review process for large developments. In all levels of environmental review, require an inventory of the changes to GHG emissions that will result from the project or plan, and identification of strategies that will be undertaken to offset all net new emissions or to help meet state or regional emission goals. Offsets can include, for example, preserving open spaces and converting to alternative fuel energy sources. Additionally, mitigation requirements could involve the use of a one-to-one VMT reduction measure, whereby developers would be required to invest in strategies that would reduce VMT by the expected amount to be created by the new development.

2.3.18 Research the Impact of GHG Emission Reduction Strategies on Transportation Revenue Sources

Research the impact of GHG emission reduction strategies on transportation revenue sources. Transportation revenues are largely dependent on taxes on motor fuel consumption; increases in vehicle fuel efficiency and alternative fuels will significantly reduce transportation revenue. Additionally, the increase in vehicle fuel efficiency will lower operating costs and may increase vehicle miles traveled.

Recent Actions in FL:

Phase I Report recommendation.

2.3.19 Research Alternative Ways To Fund Transportation That Creates Incentives to Drive Less

Examine alternative funding sources, taking into consideration federal, state, and local government programs as well as public-private partnerships and other potential revenue streams. Such sources may include mileage-based inspection fees, increased motor fuel taxes, increased vehicle registration fees, tolls and congestion pricing (including through public-private partnerships) and similar measures.

Recent Actions in FL:

Phase I Report recommendation.

2.3.20 CO₂ Conformity Requirements

Allocate transportation CO₂ budgets to local jurisdictions and require them to meet the budget to receive an additional amount of state funding. Technical assistance and review would be provided to help in the measurement and monitoring of emissions, as well as the modeling of future emissions to ensure transportation plans conform to the budget. An emissions trading system could be permitted between jurisdictions, at a defined market rate for emissions permits, as unlike for other air pollutants the location of GHG emissions does not matter.

TLU-3. HEAVY-DUTY VEHICLES**3.1 HEAVY-DUTY VEHICLE TECHNOLOGIES****3.1.1 Vehicle Technology Improvements (e.g., Aerodynamics)**

The fuel efficiency of freight trucks can be improved using a variety of equipment modifications (e.g., aerodynamic devices on both the tractor and on trailers, speed governors, wide-base tires, fuel efficient lubricants, LRR, automatic tire inflation devices).

Government agencies can promote truck fuel efficiency improvements with financial incentives for equipment modifications, as well as by providing outreach on the benefits of vehicle improvements to truck operators.

3.1.2 R&D on Low-GHG Vehicle Technology

The state could support R&D of low-GHG heavy-duty vehicle (HDV) technology to encourage technological innovation in the field.

3.1.3 Black Carbon Control Technologies (e.g., Use of Particulate Traps, Other Complementary Technologies)

Diesel particulate matter includes black carbon aerosols, which are thought to contribute to global warming through positive radiative forcing. Diesel particulate emissions can be reduced through the use of several types of exhaust retrofit devices and particulate traps.

3.1.4 Facilitate Adoption of New Clean Technologies—Rail and Marine Engines

There are new proposed US EPA criteria air pollutant emission standards for locomotive engines and commercial marine vessel diesel engines. Steps or incentives might be taken to introduce these technologies to the marketplace earlier than the federal requirements.

3.1.5 Single-Wide Tires, Low Resistance Radials, Automatic Tire Inflation

Government agencies can provide incentives for the use of energy efficient truck tires or technologies to improve the fuel economy of trucks. These strategies include the use of single-wide tires, LRR, and automatic tire inflation equipment.

Single-wide (rather than double-wide) tires improve the fuel economy by reducing rolling resistance for vehicles. In addition, tires specifically designed as LRR are often provided as original equipment of new vehicles. However, these are often not chosen by the consumer for replacement tires because of their increased cost, despite their long-term cost savings through fuel economy improvements. In addition, the proper inflation of tires can have a significant impact on a truck's fuel efficiency. Automatic tire inflation equipment helps maintain the optimum tire pressure.

Because each improvement eventually pays for itself (by reducing fuel consumption), a loan program for small operators or trucking owner-operators can be beneficial. An awareness

campaign can also be conducted, in conjunction with US EPA's SmartWay program, to encourage truck operators to consider these tires and technologies.

3.1.6 Hybrid Buses

Urban public transportation buses may be powered by hybrid diesel-electric engines, which may be able to provide up as much as 50% fuel economy improvements over similar sized standard diesel engines.

3.2 HEAVY-DUTY VEHICLE OPERATIONS

3.2.1 Freight Logistics Improvements/GIS

Some inefficiencies in trucking operations increase fuel consumption. For example, excessive idling, using longer or more congested routes, and hauling empty trailers increase fuel consumption. Improving freight logistics, through truck travel information and other tools (e.g., geographic information system [GIS]), can help with load matching and route and schedule optimization.

3.2.2 Enforce Speed Limits

Reducing the number of trucks traveling over the speed limit can improve the fuel economy of these trucks, which reduces GHG emissions and can also improve safety. Speed cameras, both for intercity highways and urban roads, have proven to be an effective and cost-effective means for enforcing speed limits. In addition, it may be possible to lower the speed limit on interstates, freeways, and major arterials to improve the fuel efficiency of vehicles. However, reducing speed limits on facilities designed to support higher speeds may require significant enforcement.

3.2.3 Improve Traffic Flow

Improving vehicle flow on the roadway system can reduce fuel use and GHG emissions for all vehicles, including trucks. Coordinated operation of the regional transportation network, such as through the use of freeway ramp metering, can improve system efficiency, reliability, and safety.

3.2.4 Increased Size and Weight of Trucks

Larger trucks may take advantage of economies of scale to haul more freight with a proportionally smaller increase in fuel consumption. The state could therefore consider changing state truck size and weight regulations. However, there are several issues that would have to be considered before changing truck size and weight regulations. First, it is possible that this action would induce some shipments to shift from rail to trucking, possibly increasing net GHG emissions. In addition, increasing regulations on the size and weight of trucks also raises safety concerns, and may increase road maintenance needs, among other issues.

3.2.5 Pre-Clearance at Scale Houses

Truck queuing and idling time can be reduced through pre-clearance at highway truck weigh stations and expanded use of weigh-in-motion systems.

3.2.6 Truck Stop Electrification

Truck emissions can be reduced by providing electrification at truck stops to reduce idling. These electrical hook-ups can provide power for heating, cooling, and other needs while trucks are stopped. This could be particularly beneficial at overnight rest stop locations.

Recent Actions in FL:

Executive Order 07-127 Initiative—Adopt diesel engine idle reduction standard. Specific implementation details of initiative yet to be determined by the DEP Division of Air

3.2.7 Enforce Anti-Idling

Vehicle idling can be reduced by enforcing anti-idling ordinances or encouraging the use of alternatives to idling. Many states and local governments have adopted idling regulations for trucks and buses. Alternatives to long-term truck idling include the use of technologies, such as automatic engine shut-down/start-up system controls, direct-fired heaters, auxiliary power units, and truck stop electrification.

Recent Actions in FL:

Executive Order 07-127 Initiative—Adopt diesel engine idle reduction standard. DEP Air Office has initiated rulemaking. Specific enforcement mechanisms yet to be determined by the DEP Division of Air

3.2.8 Clean Freight Operating Improvements

The state could require or enforce the covering of rail cars. For example, uncovered coal trains result in fugitive coal dust emissions. The state could also consider ways to improve truck operations to reduce associated particulate (black carbon) emissions. For example, ports could maximize the implementation of “paperless gates,” such as through the use of a web-based booking system to prevent gate congestion and idling.

3.2.9 Freight Villages/Consolidation Centers

Provide economic incentives and siting assistance for the development of freight consolidation centers. These centers can reduce the number of truck trips taken by combining the loads of multiple underutilized trucks. When paired with intermodal railyards they can also help make rail freight transportation, which produces fewer GHGs than trucking, more attractive.

3.3 INCREASING LOW-GHG HEAVY-DUTY TRANSPORTATION OPTIONS

3.3.1 Intermodal Freight Initiatives

This option focuses on strategies to encourage more use of rail freight, for example through improvements to railroad infrastructure and railyards. In many cases, carrying freight by rail rather than trucks can reduce emissions and fuel consumption, while also reducing congestion on major roadways. Shifting freight from trucks to rail also decreases impacts on highway infrastructure, and may reduce truck-related idling and GHG emissions and particulate matter.

3.3.2 Feeder Barge Container Service

Marine container shipping is often assumed to be too slow for domestic freight, but Europe has seen high growth rates in water-borne (especially river) container freight transported over relatively short distances. This option would support policies and infrastructure investment to shift more freight back to marine shipments.

3.3.3 Increase Rail Capacity and Address Rail Freight System Bottlenecks

Increasing rail capacity may allow some freight to shift from trucks to rail. In addition, rail infrastructure improvements could enable more use of the more fuel-efficient double-stack rail cars.

3.3.4 Shift Freight Movements From Truck to Rail

Provide economic assistance and regulatory streamlining for the improvement of intermodal railyards and the relief of rail freight bottlenecks. It is much more fuel efficient to move freight by rail rather than by truck. Moving freight from highways to rail would also relieve congestion on highways, improving the fuel economy of remaining vehicles.

3.3.5 Promote Strategies To Ease the Movement of Freight in More GHG-Efficient Ways

Provide economic assistance and regulatory streamlining for the improvement of intermodal railyards, relief of rail freight bottlenecks, and encouragement of short sea (coastal) shipping. Provide technical assistance and promote awareness to freight users of the environmental benefits of adjusting their supply chain towards more GHG-efficient modes (rail, marine, and pipeline).

Recent Actions in FL:

Phase I Report recommendation.

3.4 HEAVY-DUTY VEHICLE INCENTIVES AND DISINCENTIVES

3.4.1 Procurement of Efficient Fleet Vehicles (Public, Private or Other)

This option would provide incentives for or discounts for fleet operators for the purchase of more fuel-efficient heavy vehicles. It would also provide education and encouragement for “right-sizing” fleet vehicles, purchasing the most fuel-efficient vehicle for freight needs.

Recent Actions in FL:

DMS is directed in Executive Order 07-126 that when procuring new vehicles, to approve only those with the greatest fuel efficiency in a given class.

3.4.2 Incentives To Retire or Improve Older, Less Efficient Vehicles

GHG emissions can be reduced from heavy-duty diesel vehicles by developing and implementing an incentive program to accelerate the replacement or retirement of the highest-emitting diesel vehicles. Starting with the 2007 model year, stringent new federal emission standards for new heavy-duty diesel vehicles take effect. In addition, the fuel efficiency of vehicles declines over time due to wear and tear. Incentives can be offered to the owners of older

vehicles to retire their vehicles early and replace them with vehicles meeting the 2007 emission standards.

3.4.3 Maintenance and Driver Training

Better driver information and education can lead to improvements in fuel efficiency. Drivers need to be aware of maintenance issues that cause an increase in pollution and heavy vehicle operating costs. In addition, driver education programs could encourage energy-efficient driving habits, such as speed control and reductions in idling.

3.4.4 Increased Emission-Based Truck Tolls or Highway User Fees

Emission-based truck tolls and highway user fees can help reduce congestion and thereby reduce GHG emissions. In addition, roadway tolling can be used to provide revenue for construction or operation of more energy efficient modes of transportation (e.g., rail improvements).

TLU-4. INTERCITY PASSENGER TRAVEL: AVIATION, HIGH-SPEED RAIL, BUS

4.1 High-Speed Rail

Provide financing, regulatory relief, and the use of eminent domain to develop, publicly or privately, a high speed intercity passenger rail system serving major urban areas. Provide additional financial assistance to improve services already provided by Amtrak on other routes. This would allow for the more energy efficient movement of people, reducing GHG emissions associated with aircraft activity and highway travel while eliminating congestion for those traveling on the highway.

Recent Actions in FL:

In 2000, Florida voters authorized funding of a high-speed rail. However, Florida voters repealed the funding in 2004.

4.2 Integrated Aviation, Rail, Light Rail, Bus Networks (Planning, Governance, and Investment)

Encourage integrated transportation infrastructure between cities to support connectivity of alternative transportation modes. Intermodal passenger terminals shared between bus, rail, transit and possibly airports can facilitate shifts away from personal vehicles.

4.3 Aircraft Emissions

Support increased operational efficiency of aircraft to reduce GHG emissions. Incentives or subsidies can be provided to accelerate implementation of a number of air traffic control innovations that are well under development (reduced vertical separation minimums [RVSM], communication, navigation, surveillance/air traffic management [CNS/ATM], continuous descent approaches [CDA]) at state airports. Other improvements can include reduced aircraft engine idle time at the gate and on the runway, R&D of emission-reducing technologies for aircraft, and the use of ground tractors to pull aircraft the full distance from the gate to the taxiway (rather than inefficiently using the aircraft's engines for this purpose—already implemented by Virgin Atlantic).

4.4 Airport Ground Equipment

Reduce airport emissions through improved runway management and ground support equipment. This may include using technologies such as auxiliary power units, alternative fuels and electrification of gates.

4.5 Intercity Bus Incentives and Subsidies

Offer incentives to potential patrons such as user-subsidies. Provide loans or subsidies to operators (public or private) to offer improved and more affordable intercity bus service.

TLU-5. OFF-ROAD VEHICLES (E.G., CONSTRUCTION EQUIPMENT, OUTBOARD MOTORS, ALL-TERRAIN VEHICLES)**5.1 Incentives for Purchase of Efficient Vehicles and Equipment**

Adopt a variety of programs to increase purchase of fuel-efficient or low-GHG vehicles and equipment (including pure electric, hybrid, plug-in hybrid, and other alternative fuel vehicles). State incentives could include registration fees, feebates, and tax credits. Feebates would provide incentives for reduced GHG emissions by creating fees on relatively high emission/lower fuel economy vehicles, and rebates or tax credits on low emission/higher fuel economy vehicles. Higher vehicle registration fees can be charged for vehicles that have lower fuel economy, or vehicles that use alternative fuels could be charged a lower vehicle registration fee. Vehicle licensing fees could be based on vehicle weight, with use of a dollar-per-vehicle-ton multiplier instead of the present broad categories of vehicle weight.

5.2 Improved Operations, Operator Training

Provide off-road operations training and educational materials to increase public awareness of maintenance issues that may cause an increase in pollution and vehicle operating costs.

5.3 Increased Use of Alternative Fuels or Low-Sulfur Diesel

Increase availability, accessibility and usage of alternative fuels and low-sulfur diesel for off-road vehicles by adopting a low GHG fuel standard, for example.

5.4 Adopt Green Port Strategy (Port Land-Side: Clean-Up Port Dwelling and Cargo Handling Equipment Operations)

Adopt port measures to encourage more energy efficient technologies for vessel dwelling (e.g., plug-in technology, vehicle retrofits) and for land-side cargo handling equipment (e.g., “Clean Truck Fees,” low sulfur vehicles).

5.5 Low Carbon Fuel (Off-Road and Recreational Marine)

Expand low carbon fuel use to off-road and recreational marine vehicles. Provide incentives and support for low carbon fuel infrastructure development.

5.6 Locomotive Idling Reductions

Reduce locomotive idling including auxiliary engines to help maintain power, as well as plug-in power receptacles in the proposed train storage yards.

Recent Actions in FL:

Executive Order 07-127 Initiative—Adopt diesel engine idle reduction standard. Specific implementation details of initiative yet to be determined by the DEP Division of Air.

5.7 Inclusion of Idling Reduction Requirements

Include clauses in construction contracts that would restrict idling time for construction equipment.

5.8 All Port-Related Strategies Including Diesel Cranes at the Port-Electrification or Other GHG-Reducing Alternatives

Encourage Clean Diesel Cranes and consider electrifying, or other methods to reduce GHG emissions.

Recent Actions in FL:

Executive Order 07-127 Initiative—Adopt diesel engine idle reduction standard. Specific implementation details of initiative yet to be determined by the DEP Division of Air

5.9 “Shore Power” at Port Sites

Provide plug-in power at port sites to enable shipping vessels and cruise ships to turn off engines and reduce idling. Capital costs can be offset in part by federal grant funds (e.g., US EPA \$50,000 grant to Seattle City Light for Port of Seattle Shore Power).
